

Git Fix Guide (Beginner Friendly)

1. You created a local repo using:

```
git init
```

2. You added files and committed them:

```
git add .
```

```
git commit -m "Add All files"
```

3. You set the main branch:

```
git branch -M main
```

4. You added your remote repository:

```
git remote add origin https://github.com/aru447/Pythonquestion
```

5. When you tried to push:

```
git push -u origin main
```

You got an error because the remote repo already had files.

6. To fix this, run:

```
git pull origin main --allow-unrelated-histories
```

7. Git opened Vim for a merge message.

To exit Vim:

Press ESC

Type :wq

Press ENTER

8. After exiting Vim, push again:

```
git push -u origin main
```

9. Your local repository is now successfully synced with GitHub.
